Task: 8 01000 A/C System - Diagnose

Department: Service

Complaint: Check A/C system performance and advise.

Correction: A/C system cools to 46 degrees while ambient is 63 degrees. All fan speeds and bleed doors work properly. Fan hub stays at similar speed to hub. When key off, hub does spin, but is stiff. Fan belts worn and walking in pulleys. Fan needs replaced. Pressures at 125 for HP and 40 to 18 for LP. No good air flow through cooling pack. There is no evidence of leaks. Drained coolant. Found drain valve broken. Disconnected everything and set condenser off to the side held by bungee cord. Unbolted radiator and used the A frame to remove it. Set up blocks and rested the radiator on them. Removed fan blade and shroud. Found a couple of bad spots and there is a lot of build-up in the radiator. Washed out the front and found a core broken away. Leak tested the CAC and pressurized to 25 psi and it held. Washed out CAC and blew out with shop air. Sent radiator out to repair shop. Installed fan shroud. Installed radiator. Installed new fan blade and support bars. Tightened hose clamps and installed A/C condenser. Installed CAC pipes. Installed hood springs and cables. Filled cooling system. Washed engine.
